## Introduction

Welcome to the October 2018 edition of the Jacksonville State University (JSU) Economic Update. Our goal is to be a continual source of county level data for economic developers, government policy makers, and business analysts to consider when evaluating the economic potential of northeast Alabama. Local and regional economic indicators are considered across an eleven-county area and are analyzed within several reference periods. The economic areas examined include civilian labor force and unemployment, sales and lodging taxes, price and sales trends within housing industry, and gasoline price trends. Counties analyzed are Blount, Calhoun, Cherokee, Clay, Cleburne, DeKalb, Etowah, Marshall, Randolph, St. Clair, and Talladega. A measure of annualized volatility is included for each economic category. Volatility levels are assigned as higher, moderate, or lower in analyzing data variability.

For the reference period of August 2017 through July 2018, the civilian labor force expanded at an annualized trend of 0.23 percent in the region and by 0.16 percent for the state. Over twelve months, average unemployment rate was 3.9 percent for the region and 3.8 percent for the state. The region unemployment rate from June to July 2018 decreased from 5.0 percent to 4.3 percent, while unemployment rate statewide was unchanged at 4.1 percent.

Trends in sales and lodging tax collected are reported for reference period of August 2017 through January 2018. Sales tax collection increased by 1.14 percent and decreased by 0.44 percent for the region and state for the full reference period, respectively, while increasing by 2.58 percent and decreasing by 9.95 percent over the most recent three-month trend measured from November 2017 through January 2018. Similarly, lodging tax collection decreased by 8.66 percent in the region and by 16.44 percent for the state, in the full reference period, and decreased by 25.63 percent and by 5.87 percent, respectively, for the most recent three-month trend for each category. Volatility is generally higher for lodging tax collection relative to sales tax collection; each measure of tax collection highly seasonal across reference periods.

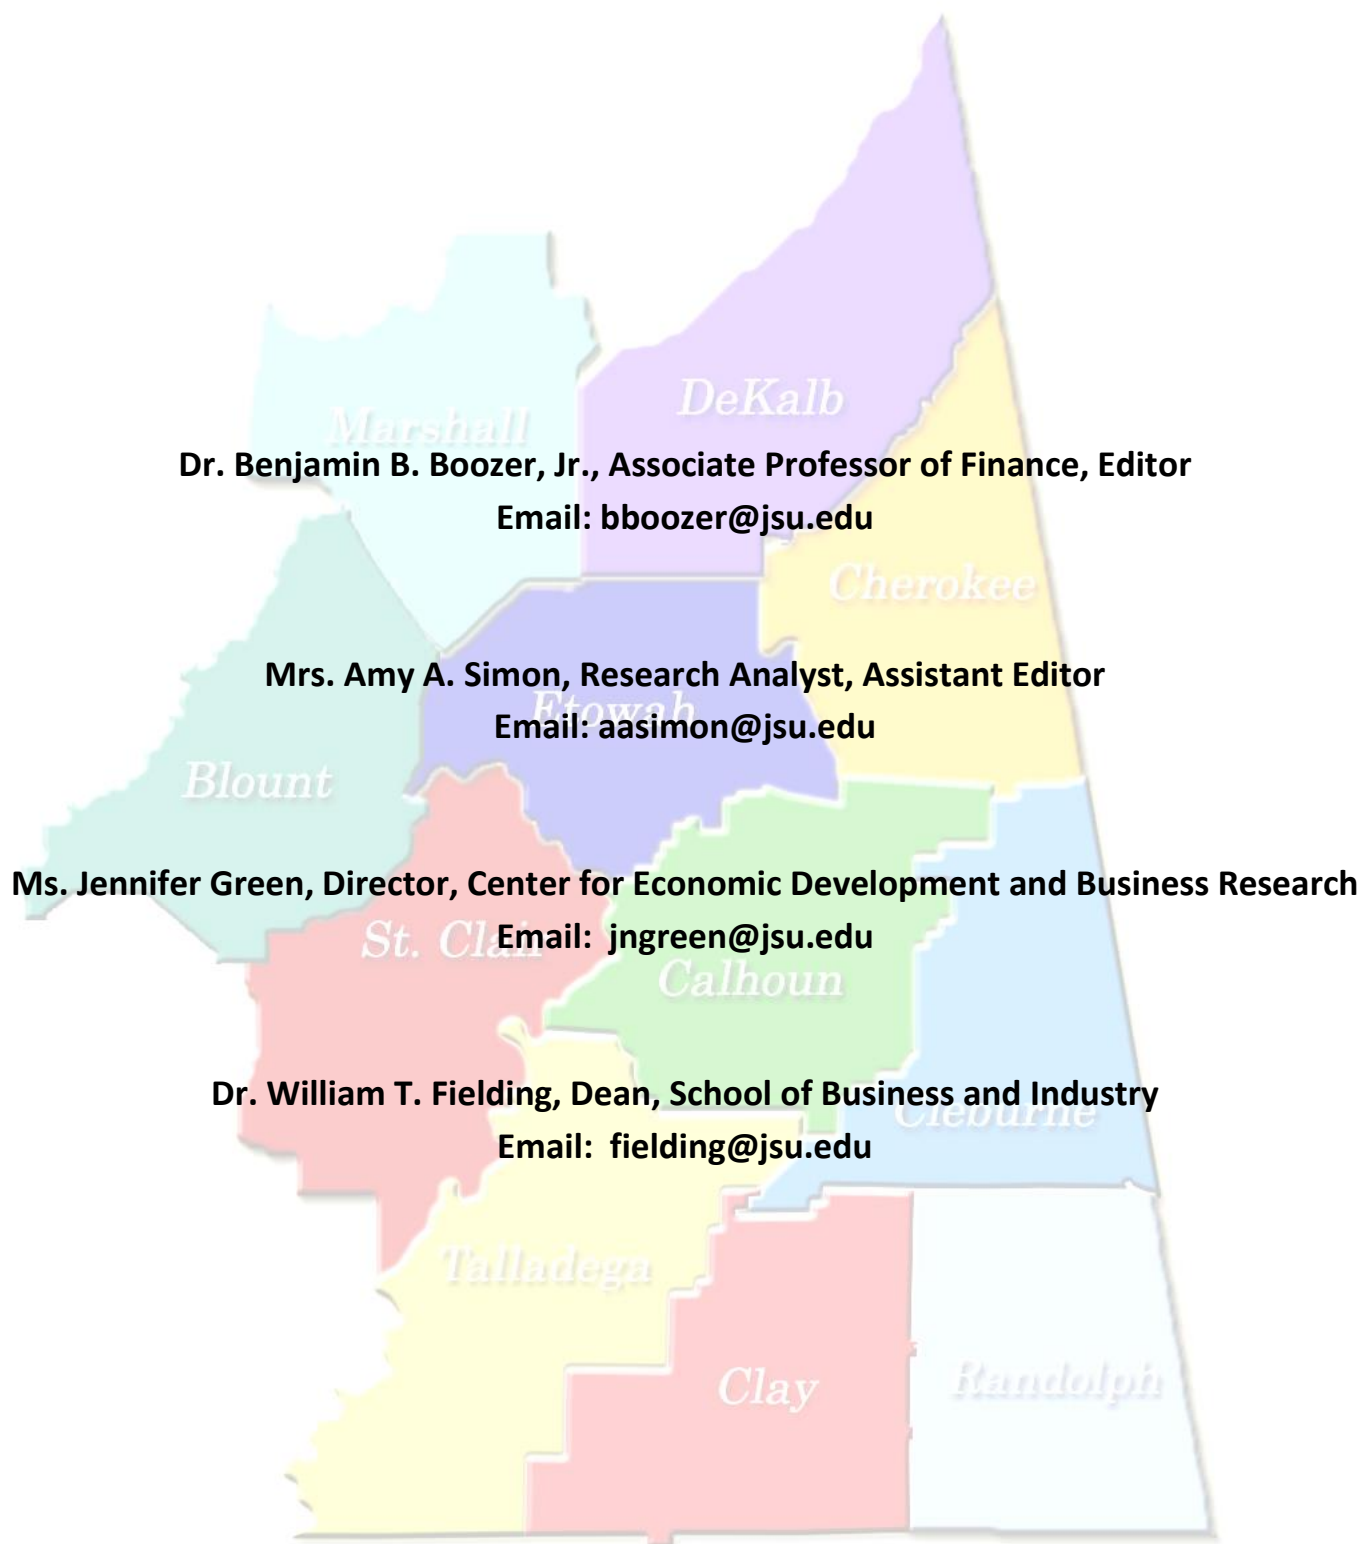

For the full reference period trend of April through September 2018, average home price (AHP) increased by 9.20 percent for the region and 4.82 percent for the state, while average sold price (ASP) increased by 4.56 percent and by 5.13 percent, respectively. In the July through September 2018 reference period trend, AHP increased by 6.95 percent in the region and by 0.53 percent for the state, while ASP increased 4.60 percent in the region and by 3.25 percent for the state, respectively. In September 2018 there were 705 homes for sale in the region, a decrease of 5 homes since August. For September 2018 AHP was \$164,300 for the region and \$190,000 for the state, while ASP was \$151,400 and \$210,000, respectively. Housing market activity is robust regionally and statewide.

Gasoline prices are analyzed for county, region, state, and nation. Within the reference period of April through September 2018, prices were slightly higher for region, state, and nation. However, in the July through September 2018 reference period and percent change from August to September prices were lower. Highest gasoline prices were recorded in June 2018 and lowest prices in April 2018 for each geographic category in this reporting period.

Sincerely,

Benjamin Boozer, Editor

## **Workforce- Civilian Labor Force and Unemployment Rate**

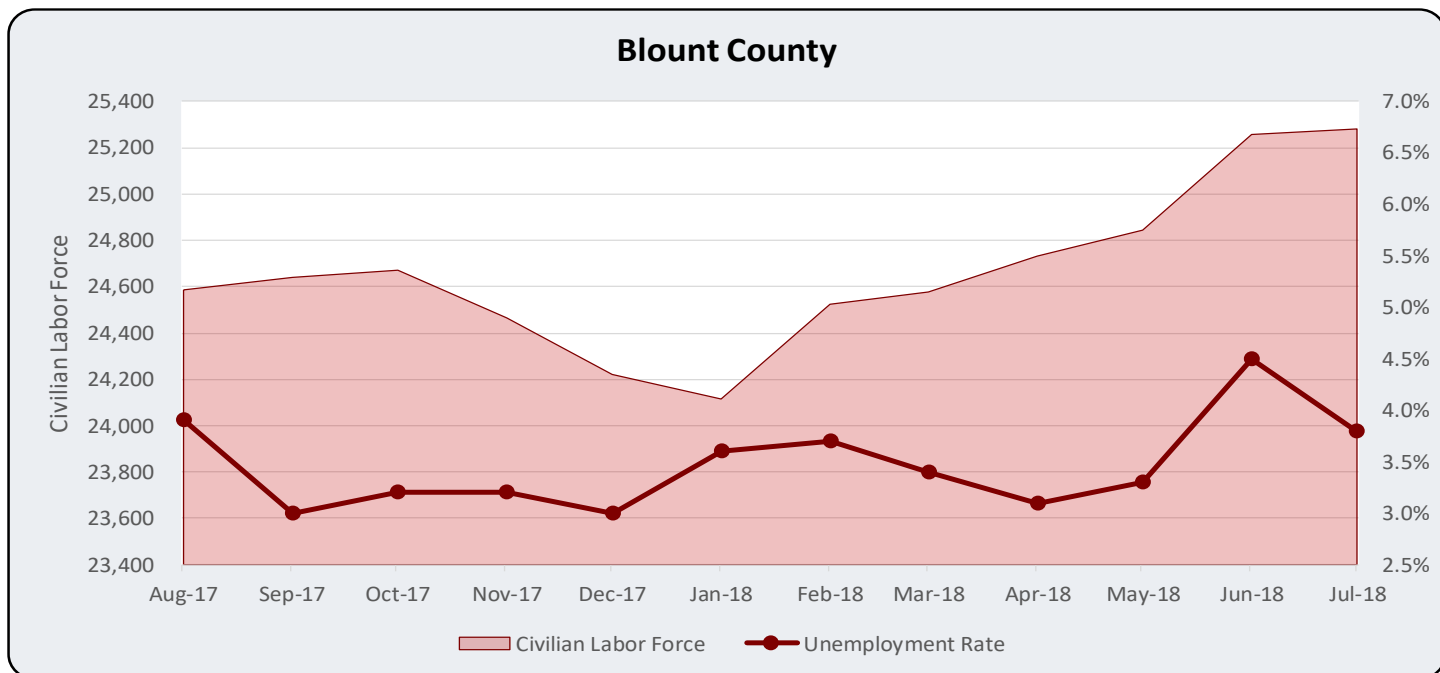

The analysis to follow considers county civilian labor force data and county, region, and state unemployment rates for reference months of August 2017 through July 2018. A twelve-month average is also included for each variable. Workforce analysis consists of the civilian labor force measured in relation to the unemployment rate for each county in the coverage area (Blount, Calhoun, Cherokee, Clay, Cleburne, DeKalb, Etowah, Marshall, Randolph, St. Clair, and Talladega counties), the region as an average of each county in the coverage area, and for the state overall.

An analysis summary considers the twelve months of the reference period and measures the rate of change in the civilian labor force for that geographic area. Positive values indicate an increasing civilian labor force trend within the reference period, while negative values reflect a declining trend. Monthly unemployment volatility for county, region, and state is annualized to reflect standard deviation from an expected value. Unemployment volatility is a relative measure of labor force stability, with values of 1.40 percent to 1.80 less labor market variance. Increases or decreases in each variable considered, civilian labor force and unemployment percent subjectively considered as moderate volatility and values lower than or equal to and higher than or equal to that range indicative of lower and higher levels of volatility, respectively. Lower volatility levels reflect rates, and directional changes for the current reporting month from the prior month are expressed in the analysis.

The civilian labor force is the sum of civilian employment and civilian unemployment. These individuals are civilians (not members of the armed services) who are at least sixteen years of age and not institutionalized and are otherwise eligible to work. From the measure of the civilian labor force it is possible to calculate the labor participation rate as the active portion of an economy's labor force that is either working or actively looking for a job. Otherwise that person is not part of the labor force and is neither counted as employed or unemployed. An increasing civilian labor force reflects that more people are entering or re-entering the labor force, an indication of economic strength.

County unemployment data are not seasonally adjusted, while State of Alabama data are seasonally adjusted. The major difference is that non-seasonally adjusted data exacerbate seasonal effects. From the information provided it is possible to calculate the employment rate as 100 percent minus the unemployment rate. Thus, if an unemployment rate for an area is 5 percent, for example, 95 percent of the civilian labor force is working. A key concern is that during periods of economic slowdown eligible workers leave the labor force and no longer look for work, thereby reducing the overall rate of labor force participation.

Workforce is an economic indicator that shows the degree which workers are participating and to what extent those workers are unable to find employment. Labor force participation rates are positively associated with general economic trends, while the unemployment rate is countercyclical and is inversely associated with economic trends. Higher levels of labor force participation and lower levels of unemployment indicate a stronger economy. Analyzing county data along with the region and state offers relative comparison.

## Sales Tax

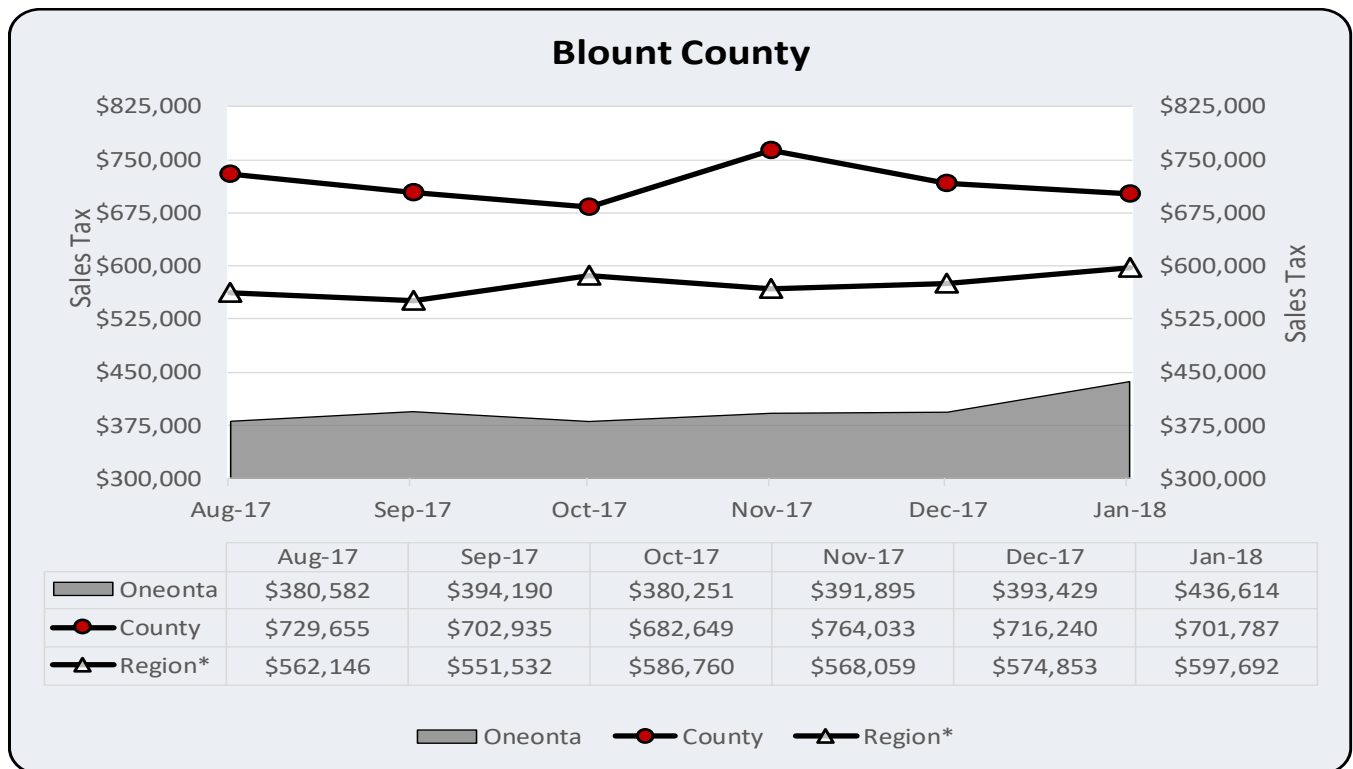

Sales tax data are provided and analyzed for a six-month reference period of August 2017 through January 2018 for each county and selected city(s). Region data are offered relative to each county and as a comparison to state data on the final chart. Sales tax collection is analyzed as follows: monthly high and low values are identified within the entire six-month reference period for the region and each local variable, county and selected city(s) within the county; trend in increases or decreases and volatility for each variable across the entire reference period and the most recent three months; and directional changes from prior month to most recent month reported. Trend values reflect rate of change of sales tax collection within each respective reporting period. Volatility indicates the extent of retail sales stability and is expressed as an annualized standard deviation of monthly variances in collection. Higher sales tax collection volatility denotes a less stable retail trade environment, while moderate and lower levels of volatility suggest that retail trade trends experience less fluctuation. Trend values and volatility offer strong measures of relative comparison.

Sales taxes collected are a measure of consumer spending and retail sector economic activity. The relationship between sales taxes collected and economic activity is positive; that is, a stronger economy produces more commerce, higher consumer spending on goods, and thus taxes collected. A weaker economy is characterized by less consumer spending and sales tax revenues. Seasonal effects will occur and have a major impact on this variable as the Christmas holiday season is a strong driver of consumer spending. Some counties may have more retail trade and some less, but the trend within the county reflects the directional strength of the retail economy for that county. With consumer spending comprising approximately 70 percent of U.S. Gross Domestic Product this is an important economic indicator to capture that aspect of the economy.

Sales taxes are tallied for each county and for selected cities within each county (Blount, Calhoun, Cherokee, Clay, Cleburne, DeKalb, Etowah, Marshall, Randolph, St. Clair, and Talladega counties) and averaged for each county across the region. With each county including various numbers of cities, we standardize sales tax reporting for the region to include a summation of each county. Region and state cross sectional and time series comparisons offer further insight into relative retail activity. Sources of data are respective county and city administrations in addition to the Alabama Department of Revenue (ADOR) and Revenue Discovery Systems (RDS).

Sales tax data are reported independently for each city, county, and state. Data do not reflect all cities within a county, but rather a representative sample. County sales tax data consist of that portion of sales taxes collected and remitted to the county. These taxes are not a summation of selected city sales tax values but are rather to be considered as a separate measure of sales tax revenue. Region sales taxes represent an average of county sales taxes within the reference area. We do not include city or other jurisdictional entities in this data to standardize an average that would apply to each county. Our analysis does not include all cities in each county, but rather selected city(s). Therefore, a more accurate depiction of region economic activity is an average of county sales tax data, which applies to each county.

We are reliant upon various sources to supply sales tax data. A database of current sales tax data is not available to access. There is also a lag associated with collection and reporting of this economic indicator that could affect the availability of the data for some reference months.

## **Lodging Tax**

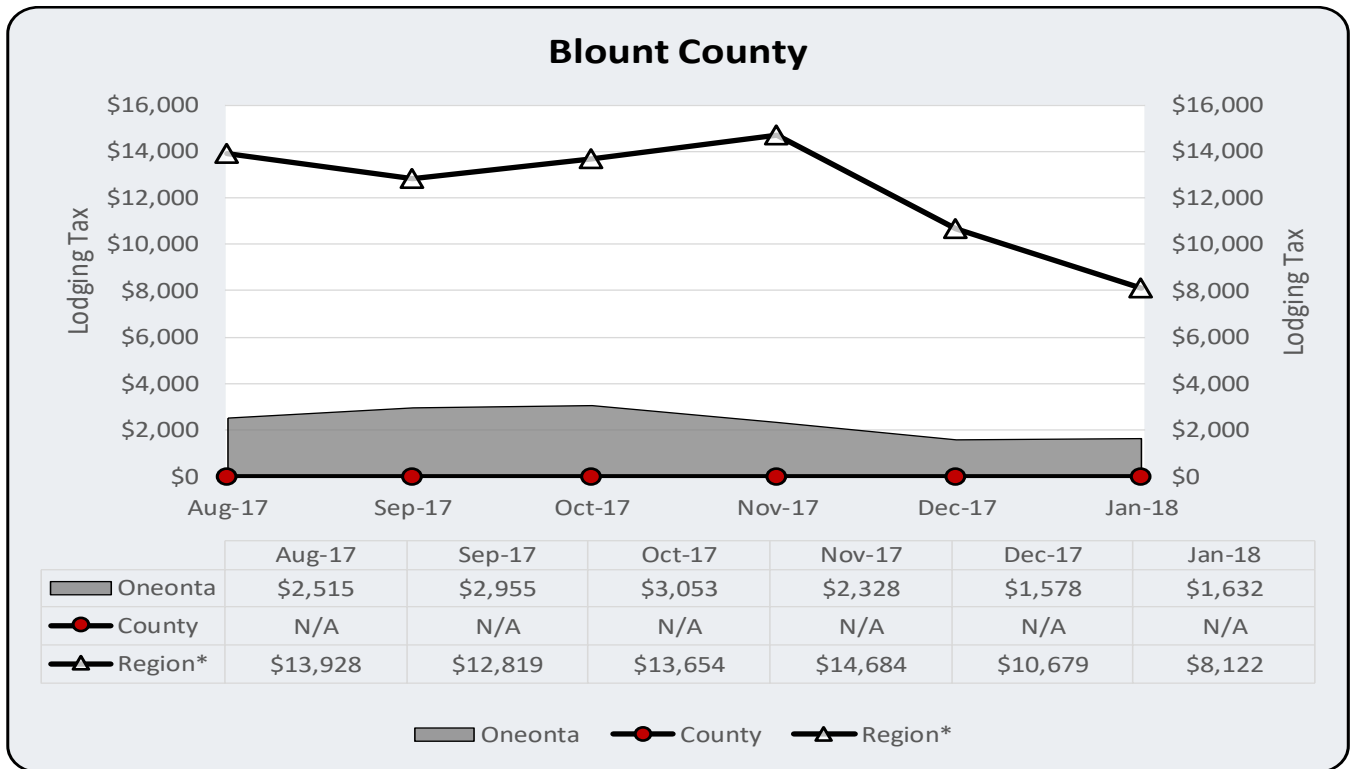

Lodging tax data are provided and analyzed for a six-month reference period of August 2017 through January 2018 for each county and selected city(s). Region data are offered relative to each county and as a comparison to state data on the final chart. Lodging tax collection is analyzed as follows: monthly high and low values are identified within the entire six-month reference period for the region and each local variable, county and selected city(s) within the county; trend in increases or decreases and volatility for each variable across the entire reference period and the most recent three months; and directional changes from prior month to most recent month reported. Trend values reflect rate of change of lodging tax collection within each respective reporting period. Volatility indicates the extent of lodging stability and is expressed as an annualized standard deviation of monthly variances in collection. Higher lodging tax collection volatility denotes a higher variation in the level of lodging activity, while moderate and lower levels of volatility suggest less fluctuation. Trend values and volatility offer strong measures of relative comparison.

The relationship between lodging taxes collected and economic activity is positive; that is, a stronger economy produces a higher need for lodging and thus more taxes are collected. Some counties may have more need for lodging and some less, but the trend within the county reflects the directional strength of the economic activity for that county. A strong basis for including lodging taxes in this publication is as a measure of tourism activity. Seasonal effects will occur with this variable, especially for counties that are destination driven for tourists at various times of the year.

Lodging taxes are collected for selected cities within each county of the coverage area (Blount, Calhoun, Cherokee, Clay, Cleburne, DeKalb, Etowah, Marshall, Randolph, St. Clair, and Talladega counties) and averaged for each county. Region and state cross sectional and time series comparisons provide further insight into relative economic activity. Sources of data are respective county and city administrations in addition to the Alabama Department of Revenue (ADOR) and Revenue Discovery Systems (RDS).

Lodging tax data are reported independently for each city, county, and state. Data for each selected city in a county do not reflect all cities within that county, but rather a representative sample. County lodging tax data consist of that portion of lodging taxes remitted to the county. These taxes are not a summation of selected city lodging taxes but are rather a separate measure of lodging tax revenue. Region lodging taxes represent an average of county lodging taxes within the reference area. We do not include city or other jurisdictional entities to standardize an average that would apply to each county analysis. Our analysis does not include all cities in each county, but rather selected city(s). Therefore, a more accurate depiction of region economic activity is an average of county lodging tax data, which applies to each county.

We are reliant upon various sources to supply lodging tax data. A database of current lodging tax data is not available to access. There is also a lag associated with payment and reporting of this economic indicator that could affect the availability of the data for some reference months.

Volatility	Moderate	Moderate	Higher	Moderate	Moderate
<b>Reference Period: Dec 17 - Jan 18</b>					
Change	↓	↓	↓	↓	↓

Note: Trend is a calculated rate of change from an exponential curve that best fits the data across each reference period. Beginning and end points do not necessarily reflect trend across entire reference period. Volatility is measured as an annualized standard deviation from an expected value of each variable analyzed. Volatility levels are subjectively assigned as follows: "Higher" as greater than or equal to 100 percent; "Moderate" as 40 percent to less than 100 percent; and "Lower" as less than 40 percent.

## **Housing- Average Home Price**

For the reference period of April through September 2018, this analysis considers the average home price by county (Blount, Calhoun, Cherokee, Clay, Cleburne, DeKalb, Etowah, Marshall, Randolph, St. Clair, and Talladega counties) in relation to the region average consisting of each county, and the number of homes for sale. Comparison within these three categories offers insight into the relative strength of the housing market on the local level compared to the state. Average home price by county and region and number of homes for sale are analyzed as follows: monthly high and low values are identified within the entire six month reference period; trend increases or decreases and volatility for each variable across the entire reference period and the most recent three months; directional changes from prior month to most recent month reported; and home price averages by county and region for the most recent month of the reporting period, including the number of homes for sale.

Trend values reflect rate of change within each respective reporting period. Volatility indicates the extent that home prices and number for sale are relatively stable and is expressed as an annualized standard deviation of monthly variances. Higher home price volatility denotes a higher variation in pricing because of market conditions, while moderate and lower levels of volatility suggest less fluctuation. Trend values and volatility offer strong measures of relative comparison.

Higher average home prices are positively related to economic conditions for that geographic area. Higher demand for housing typically reflects a stronger labor market and general economic conditions and has an upward push on home prices. Supply of homes will usually increase under these conditions and have some effect on limiting home price increases. The number of houses for sale is also included in the analysis. Higher numbers of houses for sale (both new and existing homes) are generally inversely related to housing market and economic conditions, especially if the trend in sold prices is negative.

The housing sector of the economy is an important barometer of economic conditions. Owning a home has traditionally been a personal goal for most Americans and represents a component of personal economic success. Economic conditions within communities are a driver of supply and demand within the housing market. Home value may be measured by average home prices or average sales prices. The former represents the market value of existing homes, while the latter indicates average price received for recently sold new or existing homes.

Slower economic conditions dampen demand for homes and inventory of homes for sale builds as less demand for housing manifests. A higher inventory of houses for sale suggests that home prices are either too high, employee migration into or away from an area has slowed, or demand has otherwise decreased. The variable may also reflect a higher supply of homes by investors, but this effect would tend to be smaller than demand for housing.

## Blount County

## Marshall County

Source: [www.realtor.com](http://www.realtor.com)

\*Region average represents the average home price across all eleven counties within the region.

Housing Summary: Average Home Price (AHP) Marshall County			
	County AHP	# For Sale	Region AHP
<b>Reference Period: Apr 18 - Sep 18</b>			
High	Aug-18	Sep-18	Sep-18
Low	Apr-18	Apr-18	Apr-18
Trend	14.08%	0.76%	9.20%
Volatility	Higher	Lower	Higher
<b>Reference Period: Jul 18 - Sep 18</b>			
Trend	\$ 0.12	1.71%	6.95%
Volatility	Moderate	Lower	Higher
<b>Reference Period: Aug 18 - Sep 18</b>			
Change	N/A	↑	↑
<b>Reference Period: Sep 18</b>			
Values	N/A	1,139	\$ 164,300

Note: Trend is a calculated rate of change from an exponential curve that best fits the data across each reference period. Volatility is measured as an annualized standard deviation from an expected value of each variable analyzed. Beginning and end points do not necessarily reflect trend across entire reference period. Volatility levels are subjectively assigned as follows: "Higher" as greater than or equal to 30 percent; "Moderate" as 20 percent to 30 percent; and "Lower" as less than or equal to 20 percent.

\*Region average represents the average home price across all eleven counties within the region.

Housing Summary: Average Home Price (AHP)			
Talladega County			
	County AHP	# For Sale	Region AHP
<b>Reference Period: Apr 18 - Sep 18</b>			
High	Sep-18	Apr-18	Sep-18
Low	Apr-18	Jul-18	Apr-18
Trend	7.33%	-0.48%	9.20%
Volatility	Higher	Lower	Higher
<b>Reference Period: Jul 18 - Sep 18</b>			
Trend	3.30%	3.84%	6.95%
Volatility	Lower	Lower	Higher
<b>Reference Period: Aug 18 - Sep 18</b>			
Change	↑	↑	↑
<b>Reference Period: Sep 18</b>			
Values	\$ 159,000	744	\$ 164,300

Note: Trend is a calculated rate of change from an exponential curve that best fits the data across each reference period. Volatility is measured as an annualized standard deviation from an expected value of each variable analyzed. Beginning and end points do not necessarily reflect trend across entire reference period. Volatility levels are subjectively assigned as follows: "Higher" as greater than or equal to 30 percent; "Moderate" as 20 percent to 30 percent; and "Lower" as less than or equal to 20 percent.

## Region Average vs. State Average

Source: [www.realtor.com](http://www.realtor.com)

\*Region average represents the average home price across all eleven counties within the region that is compared in this analysis to state average.

Housing Summary: Average Home Price (AHP)			
Region vs. State			
	Region AHP	# For Sale	State AHP
<b>Reference Period: Apr 18 - Sep 18</b>			
High	Sep-18	Aug-18	Jun-18
Low	Apr-18	Jun-18	Apr-18
Trend	9.20%	0.48%	4.82%
Volatility	Higher	Lower	Higher
<b>Reference Period: Jul 18 - Sep 18</b>			
Trend	6.95%	0.78%	0.53%
Volatility	Higher	Lower	Lower
<b>Reference Period: Aug 18 - Sep 18</b>			
Change	↑	↓	↑
<b>Reference Period: Sep 18</b>			
Values	\$ 164,300	705	\$ 190,000

Note: Trend is a calculated rate of change from an exponential curve that best fits the data across each reference period. Volatility is measured as an annualized standard deviation from an expected value of each variable analyzed. Beginning and end points do not necessarily reflect trend across entire reference period. Volatility levels are subjectively assigned as follows: "Higher" as greater than or equal to 30 percent; "Moderate" as 20 percent to 30 percent; and "Lower" as less than or equal to 20 percent.

## **Housing- Average Sold Price**

For the reference period of April through September 2018, this housing analysis considers the average sold price by county (Blount, Calhoun, Cherokee, Clay, Cleburne, DeKalb, Etowah, Marshall, Randolph, St. Clair, and Talladega counties) in relation to the region average consisting of each county. Comparison offers insight into the relative strength of the housing market on the local level compared to the state. Average sold price by county and region is analyzed as follows: monthly high and low values are identified within the entire six-month reference period; trend increases or decreases and volatility for each variable across the entire reference period and the most recent three months; directional changes from prior month to most recent month reported; and sold price averages by county and region for the most recent month of the reporting period.

Trend values reflect rate of change within each respective reporting period. Volatility indicates the extent that average sold prices of homes are relatively stable and is expressed as an annualized standard deviation of monthly variances. Higher average sold price volatility denotes a higher variation in pricing because of market conditions, while moderate and lower levels of volatility suggest less fluctuation.

Home value may be measured by average home price or average sold price. The former represents the market value of existing homes, while the latter indicates average price received for recently sold new or existing homes. The housing sector of the economy is an important barometer of economic conditions. Owning a home has traditionally been a personal goal for most Americans and represents a component of personal economic success. Economic conditions within communities are a driver of supply and demand within the housing market and reflect that to the extent that individuals are entering or leaving an area, or from existing residents seeking another home that is typically of greater value.

Higher average sold prices are positively related to economic conditions for that geographic area. Higher demand for housing typically reflects a stronger labor market and general economic conditions and has an upward push on home prices. Supply of homes will usually also increase under these conditions as more listings for sale have some effect on limiting home price increases. Increases in average sold prices parallel a stronger economy and more demand for housing in that geographic area. If average sold prices are decreasing, conversely, this suggests that sellers are reducing prices to sell the home or that tepid housing market conditions reflect weak demand.

Considering changes in housing data within three distinct reference periods of six months, three months, and one month isolates various points in time that might otherwise lead to erroneous conclusions because of seasonal variations. While both the trend changes in average sold price and volatility of those prices support housing market strength or weakness, relative comparisons must consider the size of the base from which the averages are generated. Data are not available for the number of houses sold, but a more vibrant housing market is positively correlated with higher levels of analysis validity.

## Region Average vs. State Average

Source: [www.realtor.com](http://www.realtor.com)

\*Region Average represents the average sold price of homes across all eleven counties within the region that is compared to the state average sold price in this analysis.

Housing Summary: Average Sold Price (ASP)		
Region vs. State		
	Region ASP	State ASP
<b>Reference Period: Apr 18 - Sep 18</b>		
High	Sep-18	Sep-18
Low	Apr-18	Apr-18
Trend	4.56%	5.13%
Volatility	Higher	Moderate
<b>Reference Period: Jul 18 - Sep 18</b>		
Trend	4.60%	3.25%
Volatility	Moderate	Lower
<b>Reference Period: Aug 18 - Sep 18</b>		
Change	↑	↑
<b>Reference Period: Sep 18</b>		
Values	\$ 151,400	\$ 210,000

Note: Trend is a calculated rate of change from an exponential curve that best fits the data across each reference period. Volatility is measured as an annualized standard deviation from an expected value of each variable analyzed. Beginning and end points do not necessarily reflect trend across entire reference period. Volatility levels are subjectively assigned as follows: "Higher" as greater than or equal to 30 percent; "Moderate" as 20 percent to 30 percent; and "Lower" as less than or equal to 20 percent.

Region ASP of \$138,375 may be inflated because of a suspected outlier with DeKalb County values in February 2018.

## **Gasoline- Average Sales Price**

The reference period for this analysis is April through September 2018. This analysis considers the price per gallon of regular, unleaded gasoline. Within the listed county (Blount, Calhoun, Cherokee, Clay, Cleburne, DeKalb, Etowah, Marshall, Randolph, St. Clair, and Talladega counties) are selected cities (Blount – Oneonta; Calhoun – Anniston, Jacksonville, and Oxford; Cherokee – Centre; Clay – Ashville and Lineville; Cleburne – Heflin; DeKalb – Fort Payne and Mentone; Etowah – Gadsden, Glencoe, and Rainbow City; Marshall – Albertville and Guntersville; Randolph – Roanoke and Wedowee; St. Clair – Moody and Pell City; Talladega – Lincoln, Sylacauga, and Talladega) chosen with data available for analysis. County trends are compared to region trends in measuring relative economic strength.

Gasoline price trends are further considered as follows for each county, selected city(s) within that county, and region: monthly high and low values, trends, and volatility are identified within the entire reference period; most recent three month trend of increases or decreases in price and volatility; directional change representing an increase or decrease in price from prior month to most recent month reported for each jurisdiction; and directional movement of local, county and selected city(s) prices, relative to region gasoline prices in the most recent month reported.

While gasoline price trends often parallel across geographic categories, price volatility differences exist. A measure of volatility captures to what extent price variability exists as a relative measure of the consistency of price levels across time periods. Higher volatility denotes less price consistency, while moderate and lower volatility levels reflect a greater level of price consistency. By depicting trend analysis along three different reference periods for each variable not only are relative comparisons available, but also how that trend is changing at different points in time. In the region versus state tab on the gasoline price analysis we include national gasoline averages in addition to state and region to further define price and price movements for this commodity. Volatility is relatively low between and among geographic areas in the region and state, but frequently does not closely correlate when considered relative to national averages.

Gasoline pricing is an economic indicator to which almost everyone can relate. The price of gasoline affects an economy in one of two ways: (1) as a cost to consumers who spend primarily for automobile gasoline for transportation and (2) as a cost to suppliers and producers as a cost of operating a business. Higher prices for gasoline, all else being equal, represent a reduction in consumer purchasing power, and thus represent less money available for expenditure on other goods and services. Suppliers and producers are faced with higher production costs if gasoline prices rise. These costs are sometimes absorbed but are frequently transferred to consumers as a fuel surcharge.

Source: American Automobile Association (AAA)

Note: Region values are an average of a summation of all selected city values in each county within the eleven-county region; county values are a summation of values for each selected city in the analysis for that county. Only the selected city(s) identified within each county analyzed is included in these calculations. There are cities in each county that are not included in county or region analysis.

Gasoline Price Summary Blount County			
	Region	County	Oneonta
Reference Period: Apr 18 - Sep 18			
High	Jun-18	Jun-18	Jun-18
Low	Apr-18	Apr-18	Apr-18
Trend	0.45%	0.77%	0.77%
Volatility	Lower	Lower	Lower
Reference Period: Jul 18 - Sep 18			
Trend	-0.20%	-0.15%	-0.15%
Volatility	Lower	Lower	Lower
Reference Period: Aug 18 - Sep 18			
Change	↓	↓	↓
Reference Period: Sep 18			
Local to Region	N/A	↑	↑

Note: Trend is a calculated rate of change from an exponential curve that best fits the data across each reference period. Beginning and end points do not necessarily reflect trend across entire reference period. Volatility is measured as an annualized standard deviation from an expected value of each variable analyzed. Volatility levels are subjectively assigned as follows: "Higher" as greater than or equal to 40 percent; "Moderate" as 30 percent to 40 percent; and "Lower" as less than or equal to 30 percent. Local to Region analysis represents the relationship of gasoline prices in a local jurisdiction (county or selected city) to an average price across the eleven-county region. Considering a local jurisdiction relative to region average, an up arrow indicates that the price is higher in the local jurisdiction relative to region average, a down arrow indicates that the local price is lower than the region average, and a horizontal arrow indicates equal prices.

Source: American Automobile Association (AAA)

Note: Region values are an average of a summation of all selected city values in each county within the eleven-county region; county values are a summation of values for each selected city in the analysis for that county. Only the selected city(s) identified within each county analyzed is included in these calculations. There are cities in each county that are not included in county or region analysis.

Reference Period: Aug 18 - Sep 18					
Change	↓	↓	↓	↓	↓
Reference Period: Sep 18					
Local to Region	N/A	↓	↓	↓	→

Note: Trend is a calculated rate of change from an exponential curve that best fits the data across each reference period. Beginning and end points do not necessarily reflect trend across entire reference period. Volatility is measured as an annualized standard deviation from an expected value of each variable analyzed. Volatility levels are subjectively assigned as follows: "Higher" as greater than or equal to 40 percent; "Moderate" as 30 percent to 40 percent; and "Lower" as less than or equal to 30 percent. Local to Region analysis represents the relationship of gasoline prices in a local jurisdiction (county or selected city) to an average price across the eleven-county region. Considering a local jurisdiction relative to region average, an up arrow indicates that the price is higher in the local jurisdiction relative to region average, a down arrow indicates that the local price is lower than the region average, and a horizontal arrow indicates equal prices.

Source: American Automobile Association (AAA)

Note: Region values are an average of a summation of all selected city values in each county within the eleven-county region; county values are a summation of values for each selected city in the analysis for that county. Only the selected city(s) identified within each county analyzed is included in these calculations. There are cities in each county that are not included in county or region analysis.
